RESPONSIVE WEB DESIGN / SERVICE BUSINESS

Northline — Comfort, considered.

A calm, distinctive service website that turns a visitor's problem into a clear next step.

The brief

Create a home-services landing page that makes repair, maintenance, and replacement options easy to understand, with a usable inquiry flow on desktop and mobile.

The implementation

- Original visual direction with custom CSS illustration and no external image dependencies.
- Responsive service sections, mobile navigation, and accessible form labels.
- Service buttons preselect the relevant inquiry type. Browser validation checks required fields and email format.
- A tailored local confirmation explains the next step without implying a real booking.

What was verified

- Desktop and 390px mobile layouts, including navigation and absence of page overflow.
- End-to-end service selection and inquiry preview.
- User-entered text is rendered safely rather than interpreted as HTML.
- No external network requests or browser JavaScript errors during the scripted checks.

My role

Design, front-end implementation, interaction logic, and testing using an AI-assisted development workflow.

Technology

HTML, CSS, JavaScript. Headless Chromium / Playwright browser checks.

> Demonstration boundary: this is custom-coded HTML/CSS, not a native Webflow project. The form does not send email or create appointments. A production release would connect approved business services and include additional cross-browser, accessibility, and performance review.

Created September 2026. Fictional brand and synthetic data. This is a self-directed demonstration, not a paid client engagement. No conversion, revenue, or customer outcome claims.
